Delivery Performance & Customer Satisfaction Analysis

Business Context: An e-commerce company wants to understand how delivery delays impact customer satisfaction to prioritize logistics and operational improvements.

Key Insight:
Customer satisfaction drops drastically when deliveries are late. Even a short delay of 1-5 days reduces the average review score from 3.77 to 2.62. Furthermore, over 60,000 orders are currently arriving late (6+ days), severely impacting brand reputation.

Recommendation: Implement proactive communication (e.g., automated email alerts) for orders at risk of delay to manage customer expectations and mitigate frustration.
